5 Things SASE Covers that SD-WAN Doesn't

CATO NETWORKS

MOUNTAIN PATH SOLUTIONS

SASE is on the Rise

More and more IT leaders are realizing that SD-WAN doesn't address the complete needs of the digital business. Gartner agrees with this and predicts a rapid shift to Secure Access Service Edge (SASE).

> **By 2024, more than 60% of software-defined, wide-area network (SD-WAN) customers will have implemented a secure access service edge (SASE) architecture, compared with about 35% in 2020."**

>
> Hype Cycle for Network Security, 2020

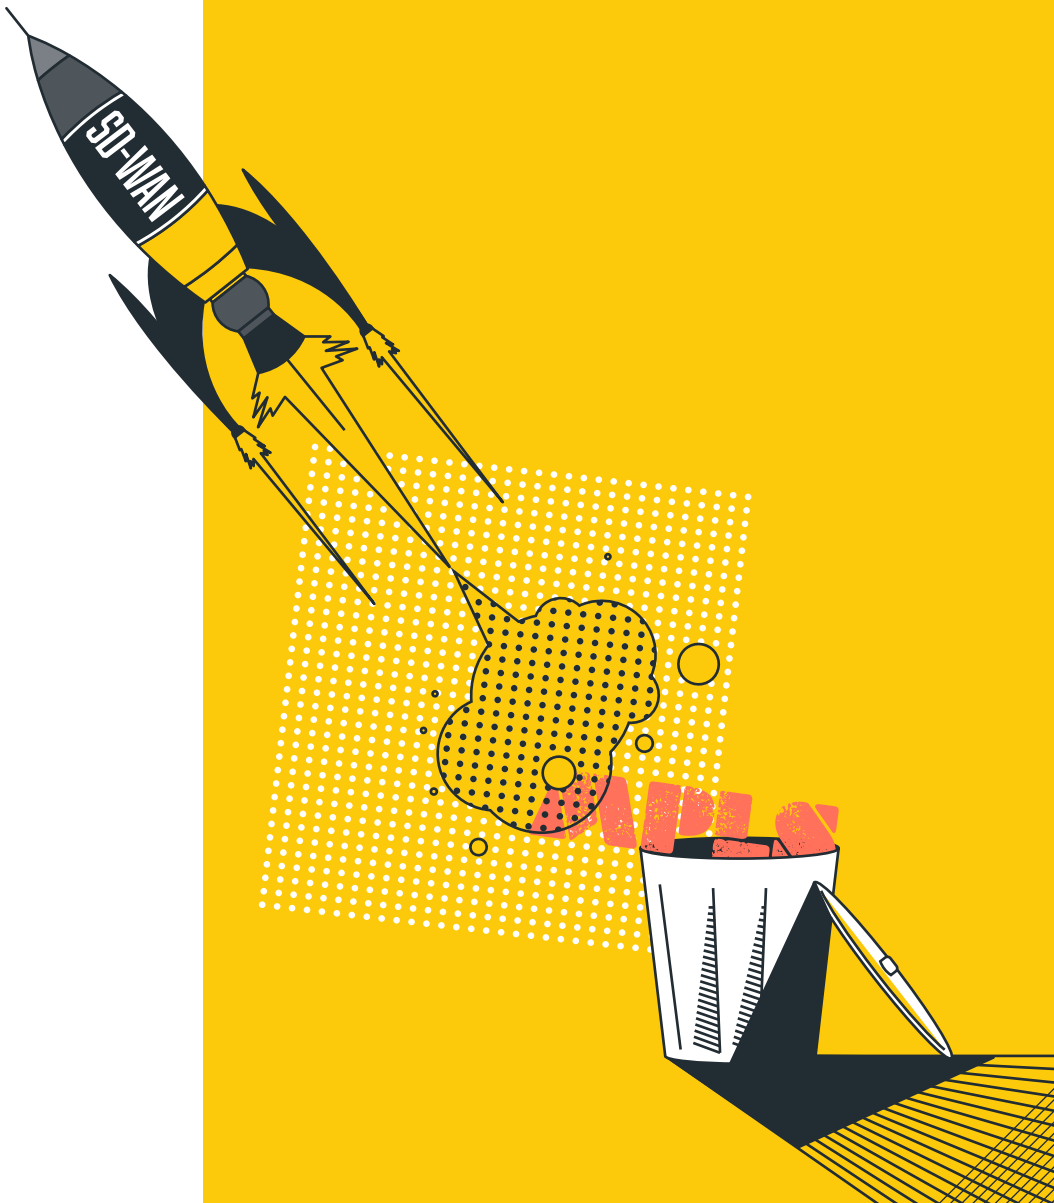
Let's understand why...

The Role of SD-WAN

SD-WAN emerged close to a decade ago, showing the potential to be a viable and cost-effective alternative to MPLS – thus making it the logical next step in WAN technology. SD-WAN was considered by many enterprises as the go-to-technology for preparing their network for the digital transformation.

At the time it made sense, because SD-WAN addresses the high cost, rigidity, and capacity constraints of MPLS. But, is this enough to deliver the level of network and security your enterprise demands?

To answer this, let's see what SD-WAN covers, and more importantly, understand what SD-WAN does NOT cover.



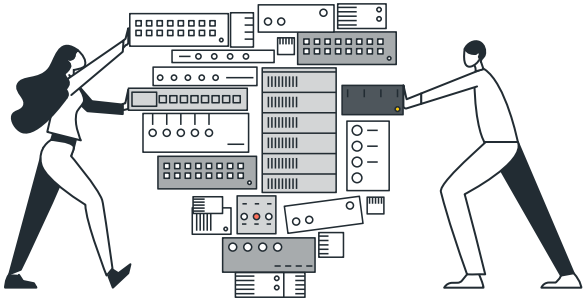
How SASE Overcomes SD-WAN Limitations

Advanced Security | Remote Workforce | Cloud Readiness | Global Performance | Simple Management

CATO NETWORKS

MOUNTAIN PATH SOLUTIONS

Advanced Security



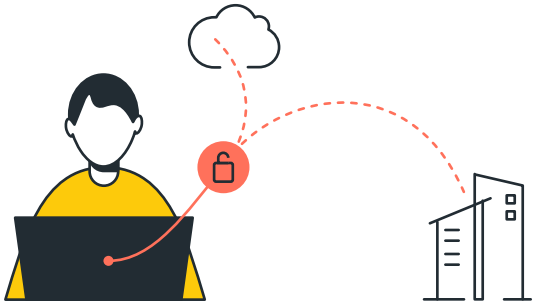
SD-WAN Shortcomings

SD-WAN lacks integrated branch security, forcing IT to integrate additional security appliances such as NGFW, IPS, and SWG. This significantly increases the cost of SD-WAN deployments and complicates ongoing maintenance required for the many appliances.

The SASE Approach

SASE's built-in network security stack delivers unified, enterprise-grade security to all edges, at all locations. There's no need to introduce and manage additional security appliances.

Remote Workforce



SD-WAN Shortcomings

SD-WAN lacks support for remote users as it was designed to reduce spend on MPLS connectivity between physical locations only. Today, secure remote access is an essential pillar for guaranteeing business continuity, yet SD-WAN doesn't address this.

The SASE Approach

Remote users, at all locations, dynamically connect to the nearest SASE PoP, benefiting from optimized and secure access to all applications, both on-premises and in the cloud.

Cloud Readiness

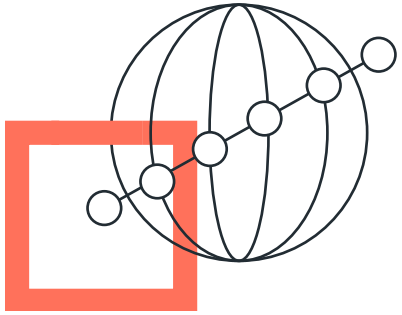
SD-WAN Shortcomings

SD-WAN is limited in its cloud readiness. As an appliance-based architecture, SD-WAN requires the management and integration of proprietary appliances to add security and remote support, and expensive premium cloud connectivity solutions like AWS Direct Connect for optimized cloud connectivity.

The SASE Approach

Cloud datacenters are connected to the SASE cloud as an integral part of the network, benefiting from all network optimization and security controls. Cloud applications require no integration, and application-specific traffic from any edge is automatically detected and sent to the PoP closest to the cloud instance serving the business.

Global Performance



SD-WAN Shortcomings

SD-WAN can't guarantee global performance without a private backbone. All SD-WAN players have had to integrate with third-party backbone providers to address this issue.

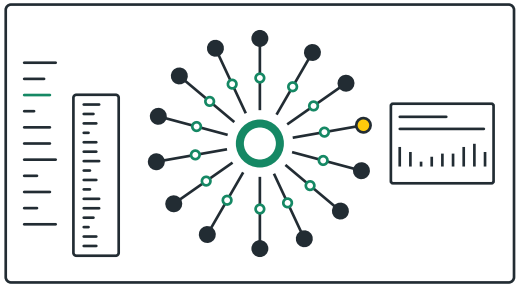
The SASE Approach

Optimal global performance is guaranteed everywhere through the SASE's global private backbone and built-in WAN optimization.

Simple Management

SD-WAN Shortcomings

SD-WAN and security solutions that aren't converged lack a single pane of glass for policy management. IT has to manage all functions separately, which makes troubleshooting and operations more complex.



The SASE Approach

SASE converges all networking and security functions, enabling full visibility into the network, and simplifying management via a unified, enterprise-wide, centralized policy.

SASE Takes Up Where SD-WAN Left Off

SASE creates a holistic platform that connects all edges to the network and security capabilities an enterprise requires. This lowers the cost, complexity, and risk of supporting the business in a dynamic environment. True SASE is the only architecture that allows you to move beyond the network complexity of today and prepare you for the opportunities of tomorrow.

True SASE services are cloud-native – dynamically scalable, globally accessible."

How to Identify a True SASE Platform

Gartner defined essential capabilities a true SASE platform must provide:

Converged SD-WAN and Security

SASE delivers network and security, including SD-WAN, SWG, CASB, SDP/ZTNA, DNS and FWaaS, all from a unified software stack with single-pass processing.

Cloud-Native Architecture

SASE delivers elasticity, adaptability, self-healing, and self-maintenance capabilities, providing a platform that is always available and easily adapts to emerging business needs.

Service Delivered via Globally Distributed PoPs

SASE PoPs need to be globally distributed, expanding their footprint to deliver a low-latency service to enterprise edges.

Support for all Network Edges

SASE creates one network for delivering equal service to all enterprise resources: datacenters, branch offices, cloud resources, and remote users.

Further explore the value of SASE

and learn how to easily differentiate between a True SASE Vendor vs. a SASE Wannabe, check out the resources below.

About Cato Networks

Cato is the world's first SASE platform, converging SD-WAN and network security into a global, cloud-native service. Cato optimizes and secures application access for all users and locations, including branch offices, mobile users, and cloud datacenters, and allows enterprises to manage all of them with a single management console with comprehensive network visibility. Cato's SASE platform has all the advantages of cloud-native architectures, including infinite scalability, elasticity, global reach and low total cost of ownership.

Connecting locations to the Cato cloud is as simple as plugging in a preconfigured Cato socket appliance, which connects to the nearest of Cato's more than 60 globally dispersed points of presence (PoPs). Mobile users connect to the same PoPs from any mobile device via a simple piece of software that is easy to install and use. With Cato, new locations or users can be up and running in hours or even minutes, rather than days or weeks.

At the local PoP, Cato provides an onramp to its high-performance global private backbone and security services. Cato monitors traffic and selects the optimum path for each packet across the backbone for performance that is as good or better than legacy MPLS. Since mobile users run across the same backbone as all other resources, the remote access experience is no different from working at the office.

With Cato, customers can easily migrate from MPLS to SD-WAN, optimize global connectivity to on-premises and cloud applications, enable secure branch office Internet access everywhere, and seamlessly integrate cloud datacenters and mobile users into a high-speed network with a zero trust architecture.

Whether its mergers and acquisitions, global expansion, rapid deployments, or cloud migration, with Cato, the network and your business are ready for whatever is next in your digital transformation journey.

MOUNTAIN PATH SOLUTIONS

Cato SASE. Ready for Whatever's Next.

Cato Cloud

- Global Private Backbone
- Edge SD-WAN
- Security as a Service
- Cloud Datacenter Integration
- Cloud Application Acceleration
- Secure Remote Access
- Cato Management Application

Managed Services

- Managed Threat Detection and Response (MDR)
- Intelligent Last-Mile Management
- Hands-Free Management
- Site Deployment

ISO 27001 Certified

Gartner peerinsights Customer first
